

GEOFAT SGP

Chemical Nature:	combination of tallow and natural additives
Active Substance:	approx. 71%
pH (10%):	approx. 7,5
Ionic Charge:	anionic
Aspect:	yellow solid
Utilization:	All vegetable-tanned leathers

PROPERTIES

GEOFAT SGP is an animal tallow based fatliquor especially developed for vegetable-tanned leathers. It provides a high degree of softness as well as an enhanced burnishing effect, bringing out the typical characteristics of vegetable-tanned vachetta-like leathers. The degree of softness and the intensity of the burnishing effect are directly linked to the amount offered and the way GEOFAT SGP is used. It is recommended to use this product in two different ways: in the fatliquoring float, together with the other fatliquors used in the main fatliquoring process. In this case, it is recommended to apply a percentage that varies from 2 to 5%. On articles where the characteristics provided by tallow such as burnishing, fullness and strong lubrication are to be exhibited, it is recommended to apply GEOFAT SGP at the end of the process. . Once the vegetable tanning process is over, the leather must be dried and the fatliquoring must be applied without the addition of water, running the drum until the total distribution and penetration of GEOFAT SGP are achieved. In this case, use between 8 and 15%. Leather treated with GEOFAT SGP is recommended for the production of various types of articles such as footwear and leathersgoods.
